# 1 Overview

1. 本文頁碼標記依照實體書 [1] 的頁碼。

2. TKB 筆記 [2] 章節頁碼：

Chapter	Page No.	Importance
1	1	★★★★
2	13	★★★★
3	18	★★★★★
4	34	★★★★★
5	43	★★★
6	48	★★★
7	×	★
8	×	★★★

3. 省略第 7 章。

Dynamic Programming algorithms		
Problem	Time complexity	Space complexity
Making change	$O(kn)$	$O(n)$
Fractional Knapsack problem	$\Theta(n \log n)$	$O(n)$
0/1 Knapsack problem (DP)	$O(n2^{\log W})$	$O(n2^{\log W})$
0/1 Knapsack problem (Branch-and-Bound)	$O(2^n)$	
Longest Common Subsequence (LCS)	$O(mn)$	$O(mn)$
Longest Increasing Subsequence (LIS)	$O(n^2)$	$O(n^2)$
Longest Common Substring	$O(mn)$	$O(mn)$
Minimum Edit Distance	$O(mn)$	$O(mn)$
Matrix-chain Multiplication	$O(n^3)$	$O(n^2)$
Traveling Salesperson problem	$\Theta(n^2 2^n)$	$O(n2^n)$
Optimal Binary Search Tree (OBST)	$\Theta(n^3)$	$\Theta(n^2)$

Graph algorithms		
Problem	Time complexity	Remark
Depth-First Search (DFS)	$O( V  +  E )$	
Kosaraju's	$O( V  +  E )$	
Kruskal's	$O( E  \log  V )$	
Prim's (Adjacency matrix)	$O( V ^2)$	
Prim's (Adjacency list)	$O( V  E )$	
Prim's (Min-Heap, Adjacency list)	$O( E  \log  V )$	
Prim's (Fibonacci heap, Adjacency list)	$O( E  +  V  \log  V )$	
Sollin's (Borůvka's)	$O( E  \log  V )$	
Dijkstra's (Min-heap)	$\Theta(( E  +  V ) \log  V )$	Greedy, no negative edges or cycles
Dijkstra's (Fibonacci-heap)	$\Theta( E  +  V  \log  V )$	
Bellman-Ford	$O( V  E )$	DP
Floyd-Warshall	$\Theta( V ^3)$	DP, no negative cycles
Johnson's	$\Theta( V  E  +  V ^2 \log  V )$	No negative cycles
Ford-Fulkerson	$O( E  f^* )$	Greedy, $f^*$ 為最大流
Edmond-Karp	$O( V  E ^2)$	
Push-relabel	$O( V ^2 E )$	

## 2 Summary

### 1. Theorem (100) Matrix-chain Multiplication:

- $$m[i, j] = \begin{cases} 0 & , i = j \\ \min_{i \leq k \leq j-1} \{m[i, k] + m[k+1, j] + p_{i-1}p_kp_j\} & , i < j \end{cases} \quad (1)$$
- $p[0 \cdots \text{Number}(\text{Matrices})]$ , 存入矩陣大小。
- $m[1 \cdots \text{Number}(\text{Matrices})][1 \cdots \text{Number}(\text{Matrices})]$ , 初始化對角線上元素為 0。
- $s[1 \cdots \text{Number}(\text{Matrices}) - 1][2 \cdots \text{Number}(\text{Matrices})]$ ,  $s[i, j]$  存入  $m[i, j]$  中最小值對應的  $k$ 。
- 理解:  $m[i, k]$  為拆分的前部分,  $m[k+1, j]$  為拆分的後部分,  $p_{i-1}p_kp_j$  為前後部分相乘。

### 2. Theorem (111) Optimal Binary Search Tree (OBST):

- $$e[i, j] = \begin{cases} q_{i-1} & , j = i - 1 \\ \min_{i \leq r \leq j} \{e[i, r-1] + e[r+1, j] + w[i, j]\} & , i \leq j \end{cases} \quad (2)$$
  
 $w[i, j] = w[i, j-1] + p_j + q_j$

其中,  $p_j$  為 key (內部節點) 機率,  $q_j$  為 dummy key (外部節點) 機率。

- $w[1 \cdots \text{Number}(\text{Key}) + 1][0 \cdots \text{Number}(\text{Key})]$ , 初始化對角線上元素  $w[j+1, j]$  為  $q_j$ 。
- $e[1 \cdots \text{Number}(\text{Key}) + 1][0 \cdots \text{Number}(\text{Key})]$ , 初始化對角線上元素  $e[j+1, j]$  為  $q_j$ 。
- $r[1 \cdots \text{Number}(\text{Key})][1 \cdots \text{Number}(\text{Key})]$ ,  $r[i, j]$  存入  $e[i, j]$  中最小值對應的  $r$ 。
- 理解:  $e[i, r-1]$  為左子樹,  $e[r+1, j]$  為右子樹,  $w[i, j]$  為節點權重和, 因為計算 cost 時是節點階層加一。

### 3. Theorem () Minimum vertex cover (tree):

$$V(v) = \min\{1 + \text{sum}\{V(c), \forall c \in v.\text{child}\}, \text{Length}\{v.\text{child}\} + \text{sum}\{V(g), \forall c \in v.\text{child} \forall g \in c.\text{child}\}\} \quad (3)$$

First part: root is in the cover; second part: root is NOT in the cover.

4. **Theorem ()** Max-cut:

- NPC。
- 若所有邊權重皆負，則可乘上  $-1$ ，變為 Min-cut。
- 若為平面圖，可轉換為 Chinese Postman Problem（若為無向圖，即 Euler circuit，若為有向圖，則為 NPC）。

5. **Theorem (285)**

- 如果可以證明 **lower bound of worst case** of NPC problems is polynomial，則  $P = NP$ 。

Figure 1: Relationship between NP and CO-NP.

6. **Theorem ()**

- For any uniform cost RAM program  $T(n) = \Omega(S(n))$ , where  $S(n)$  is the space an algorithm uses for an input of size  $n$ .
- The capacity of each edge of a flow network can be floating-point, and it can be solved by linear programming.
- (100NYCU-57c) The value of any flow of a flow network is bounded by the capacity of only at most  $O(2^n)$  cuts.
- (109NYCU-2) 2-coloring:  $O(n^2)$ , 3-coloring, 4-coloring: superpolynomial.
- Weighted-union heuristic: Append the **smaller** list onto the **longer** list, with ties broken arbitrarily.
- $n! \neq \Theta(n^n)$ .
- A DAG with  $n$  vertices can **NOT** have more than  $\binom{n}{2}$  edges.

- Longest palindrome subsequence:

$$L(i, j) = \begin{cases} 0 & , i = j + 1 \\ 1 & , i = j \\ L(i + 1, j - 1) + 2 & , i < j \wedge s[i] = s[j] \\ \max(L(i + 1, j), L(j, j - 1)) & , \text{otherwise} \end{cases} \quad (4)$$

where  $L[1 \dots n][1 \dots n], s[1 \dots n]$

- (102NTU-4) Minimum triangulation:

$$c(i, j) = \begin{cases} 0 & , j < i + 2 \\ \min_{i < k < j} \{c(i, k) + c(k, j) + \text{dist}(i, j) + \text{dis}(j, k) + \text{dist}(k, j)\} & , \text{otherwise} \end{cases} \quad (5)$$

```
double triangulation(Point P[], int n) {
    if (n < 3)
        return 0;

    double c[n][n];
    for (int gap = 0, gap < n; gap++) {
        for (int i = 0, j = gap; j < n; i++, j++) {
            if (j < i + 2)
                c[i][j] = 0.0;
            else {
                c[i][j] = MAX;
                for (int k = i + 1; k < j; k++) {
                    double val = c[i][k] + c[k][j] + wt(
                        P, i, j, k);
                    if (c[i][j] > val)
                        c[i][j] = val;
                }
            }
        }
    }

    return c[0][n - 1];
}
```

|| }

Listing 1: Minimum triangulation.

- Sort  $n$  integers ranged from 0 to  $n^2 - 1$ : 將  $n$  個整數表示成  $n$  進位數，每個數由 2-digit 表示，範圍 0 到  $n - 1$ ，再用 radix sort 對 2-digit 排序，共兩次。
- If max frequency is  $\leq 2$  times of min frequency, Huffman code is **NOT** always better than an ordinary fixed-length code.
- Amortized analysis 與 average-case analysis 無關。
- (104NYCU-28b) (**FALSE**) If a graph has a unique MST then, for every cut of the graph, there is a **unique light edge** crossing the cut.
- (104NYCU-28c) (**TRUE**) A graph has a unique MST **if**, for every cut of the graph, there is a **unique light edge** crossing the cut.
- The worst-case running time and expected running time are equal to within **constant** factors for any randomized algorithm.
- Selection problem:  $T(n) = T(\frac{n}{5}) + T(\frac{3n}{4}) + O(n)$
- Given an **undirected** graph and a positive integer  $k$ , is there a path of length  $\leq k$ , which each edge has weight 1 and each vertex is visited **exactly** once: P, solved by Floyd-Warshall algorithm.
- Given an **undirected** graph and a positive integer  $k$ , is there a path of length  $\geq k$ , which each edge has weight 1 and each vertex is visited  $\leq$  once: NPC.
- A flow network of multiple sources can be reduced to a single source.
- Subset sum:  
 $s(i, j)$ : sum  $j$  can be found in  $\{a_1, \dots, a_i\}$

$$s(i, j) = \begin{cases} 0 & , i = 0 \\ 1 & , j = 0 \\ s(i-1, j) \vee s(i-1, j-v_i) & , j \geq v_i \end{cases} \quad (6)$$

result is

$$s(m, n) \quad (7)$$

- Hanoi tower:

- If  $n$  is even,

$$\begin{cases} A \leftrightarrow C \\ A \leftrightarrow B \\ C \leftrightarrow B \end{cases} \quad (8)$$

$$\begin{cases} A \leftrightarrow B \\ A \leftrightarrow C \\ B \leftrightarrow C \end{cases} \quad (9)$$

- Convert to undirected graph and solved by Hamiltonian path problem:

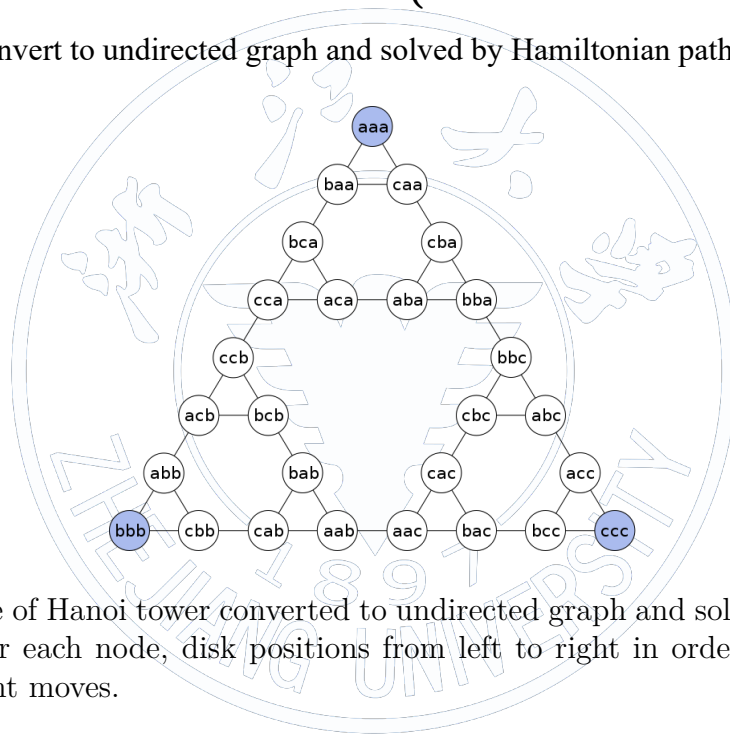

Figure 2: Example of Hanoi tower converted to undirected graph and solved by Hamiltonian path problem. For each node, disk positions from left to right in order of increasing size, and edges represent moves.

- Fibonacci search:

```
def fibSearch(arr, data):
    max = len(arr) - 1
    y = getY(fib, max + 1) # Find the largest index,
        which its value is smaller than data.
    m = max - fib[y]
    x = y - 1
    i = x
    if arr[i] < data: # Check at first.
        i += m
    while fib[x] > 0:
```

```

    if arr[i] < data:
        x -= 1
        i += fib[x]
    elif arr[i] > data:
        x -= 1
        i -= fib[x]
    else:
        return i
return -1

```

Listing 2: Fibonacci search.

- Box stacking: create a stack of boxes which is as tall as possible, but you can only stack a box on top of another box if the dimensions of the 2-D base of the lower box are each strictly larger than those of the 2-D base of the higher box.
  - (a) Generate all 3 rotations of all boxes. We consider width as always smaller than or equal to depth.
  - (b) Sort the above generated  $3n$  boxes in **decreasing** order of **base area**.
  - (c)  $msh(i)$ : Max possible stack height with box  $i$  at top of stack.

$$msh(i) = \{ \max\{msh(j)\} + height(i) \}, \quad (10)$$

$$\forall j < i \wedge width(j) > width(i) \wedge depth(j) > depth(i)$$

result is

$$\max_{0 \leq i < n} \{msh(i)\} \quad (11)$$

- Building bridge: connect as many north-south pairs of cities as possible with bridges such that no two bridges cross.
  - (a) Sort the north-south pairs on the basis of **increasing** order of **south** x-coordinates.
  - (b) Find **LIS** of north x-coordinates.
- Optimal strategy: play a game against an opponent by alternating turns. In each turn, a player selects either the first or last coin from the row, removes it from the row permanently, and receives the value of the coin. Determine the maximum possible amount of money we can definitely win if we move first.

$f(i, j)$ : max value the user can collect from  $i$ -th coin to  $j$ -th coin.

$$f(i, j) = \begin{cases} v_i & , j = i \\ \max\{v_i, v_j\} & , j = i + 1 \\ \max\{v_i + \min\{f(i+2, j), f(i+1, j-1)\}, \\ \quad v_j + \min\{f(i+1, j-1), f(i, j-2)\}\} & , \text{otherwise} \end{cases} \quad (12)$$

- (TIOJ-1097) Find the largest square submatrix with all 0s in a 0/1 matrix:

$dp(i, j)$ : max square submatrix in  $i \times j$  left upper submatrix.

$$dp(i, j) = \min\{dp(i-1, j-1), dp(i, j-1), dp(i-1, j)\} + 1 \quad (13)$$

- (UVA-10934) Dropping water balloons ( $k$  balloons and height  $n$ ):

$dp(i, j)$ : max height  $i$  balloons can be dropped  $j$  times.

$$dp(i, j) = \begin{cases} dp(i, j-1) + dp(i-1, j-1) + 1 & , arr(i, j) = 1 \\ 0 & , arr(i, j) = 0 \end{cases} \quad (14)$$

result is

$$\min_j \{dp(k, j) \geq n\} \quad (15)$$

- (TIOJ-1471) Skyline:

$dp(i, j)$ : number of legal path till the end through walking distance  $i$  and temporary height is  $j$ .

$$\begin{cases} dp(i, j) = dp(i-1, j-1) + sum(j) \\ sum(j) = sum(j) - dp(i-j, j) + dp(i, j) \end{cases} \quad (16)$$

result is

$$\sum_j dp(n, j) \quad (17)$$

- (leetcode-84) Largest rectangle in histogram:

- If the new element is higher than stack top element, push it; otherwise, pop and calculate the area until the new element is higher than stack top element.
- Maximal rectangle: Similarly, for each column, the count of 1 of each row, can be seen as the element.

- AOV network topological order is **NOT** unique.

- (leetcode-97) Interleaving string:

$dp(i, j)$ : represents if  $s_1[0 : i - 1]$  and  $s_2[0 : i - 1]$  can be combined as  $s_3[0 : i + j - 1]$ .

$$dp(i, j) = \begin{cases} \text{true} & , i = j = 0 \\ (dp(i - 1, j) \&\& (s_1(i - 1) == s_3(i + j - 1))) \parallel & \\ (dp(i, j - 1) \&\& (s_2(j - 1) == s_3(i + j - 1))) & , \text{otherwise} \end{cases} \quad (18)$$

- (leetcode-115) Distinct subsequences:

$$dp(i, j) = \begin{cases} 1 & , i = 0 \\ dp(i, j - 1) + dp(i - 1, j - 1) & , t(i - 1) = s(j - 1) \\ dp(i, j - 1) & , \text{otherwise} \end{cases} \quad (19)$$

result is

$$dp(n, m) \quad (20)$$

- $\triangle$  (109NYCU-9) Prefix sum:

$D(i, s)$ : max number of elements that can be selected from first  $i$  integers with sum  $\leq s$ .

$$D(i, s) = \max\{D(i - 1, s), D(i - 1, \min(s - a_i, 6 \times a_i)) + 1\},$$

$$\forall 1 < j \leq k, \text{ s.t. } \sum_{l=1}^{j-1} a_{i_l} \leq 6 \times a_{i_j}, 1 \leq i_1 < \dots < i_k \leq n \quad (21)$$

result is

$$D(n, 6 \times a_{n+1}) \quad (22)$$

- (109NYCU-15) 0/1 Knapsack problem: if  $W = \Theta(n^2)$ , and  $w_i \in \{1\} \vee w_i \in \{1, 2\}$ , then  $T(n) = O(n)$ .

- (leetcode-84) Largest Rectangle in Histogram:

```
def largestRectangle(heights):
    s = list()
    res = 0
    heights.append(0)

    for i in range(len(heights)):
        if not s or heights[i] > heights[s[-1]]:
```

```

        s.append(i)
    else:
        while s and heights[i] <= heights[s[-1]]:
            h = heights[s[-1]]
            s.pop()
            w = i if not s else i - s[-1] - 1
            res = max(res, h * w)
        s.append(i)
    return res

```

Listing 3: Largest Rectangle in Histogram.

- (110NYCU-2) (NP-Hard) Finding a longest simple path between 2 nodes in a directed graph where the edge-weight is 1 for every edge.
- (110NYCU-2) (NP-Hard) Finding a shortest simple path between 2 nodes in a directed graph with negative-weight cycles.
- (105NYCU-53d) The length of augmenting path between the source and sink is non-decreasing on the Edmonds-Karp algorithm.
- (101NYCU-59a) The corresponding network of max flow contains NO augmenting path.
- (100NYCU-57e) The capacity of each edge of a graph can be any real number.
